Phase 3 limitations: WinAnsi (cp1252) only — no Unicode beyond Latin-1; Bold/Italic widths approximated from regular Helvetica/Times; no kerning, no justified text. TrueType embedding lands in Phase 4.

Phase 4 — TrueType embedding

Installed Windows fonts embedded as /FontFile2 streams

Arial family (4 TTF files embedded):

Arial regular

Arial Bold

Arial Italic

Arial Bold Italic

Calibri:

Calibri regular

Calibri Bold

Calibri Italic

Verdana:

Verdana regular

Verdana Bold

Standard 14 vs embedded TTF (same words, different metrics):

The quick brown fox jumps over the lazy dog.

Latin-1 supplement via embedded Arial:

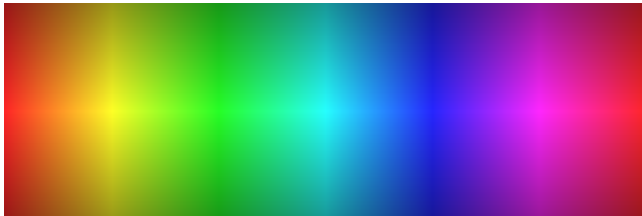

café naïve résumé façade £€ «guillemets»

Phase 4 embeds the FULL TTF font as a /FontFile2 stream. File size grows roughly by the size of each unique font face used (Arial regular ~1MB; Calibri ~700KB; etc.). Subsetting can be added later as a Phase 6 polish task to keep only the glyphs that are actually used. Encoding is still WinAnsi (cp1252); full Unicode support requires CID fonts and is out of scope.

Phase 5 — Images

TBitmap, PNG (opaque + alpha), and JPEG embedded as XObjects

TBitmap (FlateDecode RGB):

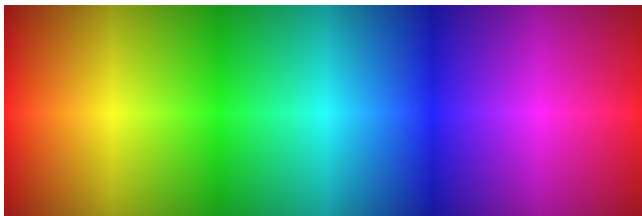

PNG checkerboard (FlateDecode RGB, opaque):

PNG with alpha (SMask) over a coloured rectangle:

JPEG (DCTDecode passthrough):

Same TPicture drawn twice (one XObject, two cm/Do calls):

Three things, done well, every time.
